- Start
- Ask the user to enter array A
- Ask the user to enter number of rotations K
- Loop till k times
  - Store the element of A that is last
  - Move the element of A that is last to the beginning
  - Keep the remaining elements in same order
- Return the rotated array A
- End

- Start
- Input integer x
- Input array A from the user
- Create an empty list leaves
- Go through each position/index in A
    - If the position is not already in leaves:
        - add position to leaves
    - if the number of positions in leaves equals x
        - return the current time
- return -1
- end

- Start
- Get array A from the user
- Create an empty dictionary
- Go through each number in A:
  - If the number are already in numbers:
    - Change its value from True to False, or False to true
  - else:
    - add the number to numbers with the value True
- Go through each number in numbers:
  - If its value is True:
    - return that number
- End

- Start
- Get array A from the user
- Set east to 0
- Set passing to 0
- Loop through each car in A:
    - if the car is 0:
        - increase east by 1
    - else:
        - add east to passing
- If passing is greater than 1000000000:
    - Return -1
- else:
    - return passing
- End

- Start
- Get the array A
- Set N to the length of A
- Loop through each number i from N to N+1:
    - Check if i is in A
        - If i is not in A:
            - Return i as the missing element
- End
